### **Press release from Eton Systems regarding patent infringement**

Eton Systems is the Swedish company that invented and developed the unique ETON system (UPS-Unit Production System) in the late 60's. Like many other innovative companies, it has been copied, which has elicited a strong reaction. Therefore, the company's board of directors has decided to take legal action against this type of copying.

Over the past 50 years, Eton Systems has constantly developed and refined the unique UPS concept. This has led to a number of vital patented and design-protected solutions that have made it possible for the company to lead the development of this type of product.

Thanks to the patents and design protection, Eton Systems has strong legal protection for its inventions. These forms of protection have provided Eton Systems with a considerable edge over competitors that lack in-house development and only try to copy products. In addition to the patent and design protection that Eton Systems holds, the company has gained unique knowledge through 50 years of continuous product development in the international textile market. This further contributes to its competitive advantage.

Customers and clients that want the UPS concept with Eton Systems' features, quality, knowledge and experience should ensure that Eton Systems is behind the product. The board of Eton Systems believes it is the company's duty to inform the market about the current situation. This is to make sure customers have no doubt regarding what they have bought and from whom.

Eton Systems therefore considers it important to take legal action against what it considers to be unauthorized copying. The stamp of quality that the UPS production philosophy represents might otherwise be compromised.
